

Iterators pair constructors for stack and queue

Document #: P1425R2
Date: 2021-01-31
Project: Programming Language C++
Audience: LEWG, LWG
Reply-to: Corentin Jabot <corentin.jabot@gmail.com>

Abstract

This paper proposes to add iterators-pair constructors to `std::stack` and `std::queue`

Tony tables

Before	After
<pre>std::vector<int> v(42); std::queue<int> q({v.begin(), v.end()}); std::stack<int> s({v.begin(), v.end()});</pre>	<pre>std::vector<int> v(42); std::queue q(v.begin(), v.end()); std::stack s(v.begin(), v.end());</pre>

Revisions

R2

- Remove the Container argument
- Add allocator support - in alignment with [LWG3506](#) [?]
- Add feature test macros

Motivation

`std::stack` and `std::queue` do not provide iterators based constructors which is inconsistent. This paper is an offshoot of [?], for which I conducted a review of existing containers and containers adapters constructors.

The lack of these constructors forces the implementation of `ranges::to` to special case container-adapters or to not support them. Their absence make it also impossible to deduce their type using CTAD.

While this is a a small change, we believe its impact on the standard is low and consistent designs are less surprising and therefore easier to use: with this change, all container-like

types, whether they are *Containers* or container adapters, can be constructed from an iterators pair, making them more compatible with ranges.

Removal of the Container argument in R2

Previous iteration had a `queue(Iterator first, Iterator last, Container c)` argument, which was added for consistency with `priority_queue`. However, it was specified to insert the range denoted by `[first, last)` at the end of `c`. LWG astutely noted that this was confusing and wanted LEWG's input.

As a result, i decided to remove this argument entirely, as I can't think of a non-confusing fix, nor can I really come up with a good justification for this parameter.

- Changing the order of parameters would be inconsistent with `priority_queue`.
- Mandating that the range is inserted at the beginning of the container has performance drawbacks.
- It is unclear that using the order of parameter to determine the order of insertion would actually make sense to users.

Implementation

This proposal has been [Implemented in libc++](#)

Proposed Wording

Definition

[queue.defn]

```
namespace std {
    template<class T, class Container = deque<T>>
    class queue {
    public:
        using value_type      = typename Container::value_type;
        using reference       = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type       = typename Container::size_type;
        using container_type  = Container;

    protected:
        Container c;

    public:
        queue() : queue(Container()) {}
        explicit queue(const Container&);
    }
```

```

explicit queue(Container&&);

template<class InputIterator>
queue(InputIterator first, InputIterator last);

template<class InputIterator>
queue(InputIterator first, InputIterator last, const Alloc&);

template<class Alloc> explicit queue(const Alloc&);
template<class Alloc> queue(const Container&, const Alloc&);
template<class Alloc> queue(Container&&, const Alloc&);
template<class Alloc> queue(const queue&, const Alloc&);
template<class Alloc> queue(queue&&, const Alloc&);

//...
};

template<class Container>
queue(Container) -> queue<typename Container::value_type, Container>;

template<class InputIterator>
queue(InputIterator, InputIterator)
-> queue<typename iterator_traits<InputIterator>::value_type>;

template<class Container, class Allocator>
queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc>
: uses_allocator<Container, Alloc>::type { };
}

```

Constructors

[queue.cons]

```
explicit queue(const Container& cont);
```

Effects: Initializes c with cont.

```
explicit queue(Container&& cont);
```

Effects: Initializes c with std::move(cont).

```
template<class InputIterator>
queue(InputIterator first, InputIterator last);
```

Effects: Initializes c with first as the first argument, and last as the second argument.

```
template<class InputIterator>
queue(InputIterator first, InputIterator last, const Alloc & alloc);
```

Effects: Initializes c with first as the first argument, last as the second argument and a as the third argument.

Definition

[stack.defn]

```
namespace std {
    template<class T, class Container = deque<T>>
    class stack {
    public:
        using value_type      = typename Container::value_type;
        using reference       = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type       = typename Container::size_type;
        using container_type  = Container;

    protected:
        Container c;

    public:
        stack() : stack(Container()) {}
        explicit stack(const Container&);
        explicit stack(Container&&);

        template<class InputIterator>
        stack(InputIterator first, InputIterator last);

        template<class InputIterator>
        stack(InputIterator first, InputIterator last, const Alloc&);

        template<class Alloc> explicit stack(const Alloc&);
        template<class Alloc> stack(const Container&, const Alloc&);
        template<class Alloc> stack(Container&&, const Alloc&);
        template<class Alloc> stack(const stack&, const Alloc&);
        template<class Alloc> stack(stack&&, const Alloc&);

        //...
    };

    template<class Container>
    stack(Container) -> stack<typename Container::value_type, Container>;

    template<class InputIterator>
    stack(InputIterator, InputIterator)
    -> stack<typename iterator_traits<InputIterator>::value_type>;

    template<class Container, class Allocator>
    stack(Container, Allocator) -> stack<typename Container::value_type, Container>;
```

```

    template<class T, class Container, class Alloc>
    struct uses_allocator<stack<T, Container>, Alloc>
    : uses_allocator<Container, Alloc>::type { };
}

```

Constructors

[stack.cons]

```
explicit stack(const Container& cont);
```

Effects: Initializes `c` with `cont`.

```
explicit stack(Container&& cont);
```

Effects: Initializes `c` with `std::move(cont)`.

```

template<class InputIterator>
stack(InputIterator first, InputIterator last);

```

Effects: Initializes `c` with `first` as the first argument and `last` as the second argument.

```

template<class InputIterator>
stack(InputIterator first, InputIterator last, const Alloc & alloc);

```

Effects: Initializes `c` with `first` as the first argument, `last` as the second argument and `a` as the third argument.

Feature test macros

Insert into [version.syn]

```

#define __cpp_lib_queue_iterators_constructor <DATE OF ADOPTION>
#define __cpp_lib_stack_iterators_constructor <DATE OF ADOPTION>

```
